Project Report: My First Web Page

Prepared by Surafel Betre | October 2026

1. Introduction

This report describes my first HTML project, a simple one-page website that introduces me to visitors. I built it to practise the basic building blocks of web pages: the document structure, headings, paragraphs, lists, links, and images. It was the first step toward the larger personal website I built afterwards.

2. Objectives

- Learn how an HTML document is structured.
- Use headings and paragraphs to organise content.
- Add a list, a hyperlink, and an image with alternative text.
- View and test the page in a web browser.

3. Tools Used

Tool	Purpose
Text editor (VS Code)	Writing the HTML code
Web browser (Chrome)	Viewing and testing the page
MDN Web Docs	Learning HTML elements and attributes

4. Project Description

The page contains a main heading with a greeting, a short introduction, a second-level heading followed by a bulleted list of my hobbies, a link to a learning resource, and a picture. Everything is written in plain HTML without any CSS or JavaScript. The complete code is shown below.

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <title>My First Web Page</title>
</head>
<body>
  <h1>Hello, I'm Surafel!</h1>
  <p>This is my first web page.</p>
  <h2>My Favourite Hobbies</h2>
  <ul>
    <li>Listening to music</li>
    <li>Exploring technology</li>
  </ul>
  <p>Visit <a href="https://developer.mozilla.org">MDN</a>
     to learn more about HTML.</p>
  <img src="photo.jpg" alt="A photo of me">
</body>
```

```
</html>
```

5. How It Works

- **<!DOCTYPE html>** and **<html>** tell the browser this is an HTML5 document.
- **<head>** holds information about the page, such as its character set and title.
- **<body>** holds everything visitors see on the page.
- **<h1>** and **<h2>** create headings, and **<p>** creates paragraphs.
- **<ul>** and **<li>** build the list of hobbies.
- **<a href>** creates the hyperlink, and **<img alt>** shows the picture with alternative text.

6. Challenges and Solutions

- **Challenge:** The image did not appear at first. **Solution:** I corrected the file path and made sure the image was in the same folder as the HTML file.
- **Challenge:** The list showed up as plain text. **Solution:** I had forgotten to close a <li> tag; fixing it repaired the layout.
- **Challenge:** Remembering which tags need closing. **Solution:** I indented my code so opening and closing tags lined up.

7. What I Learned

- How every HTML page follows the same basic structure.
- Why headings, lists, and alt text make a page clearer and more accessible.
- That testing in the browser often helps me find mistakes quickly.

8. Conclusion and Next Steps

This project gave me a solid foundation in HTML. Using what I learned, I went on to build a complete personal website with six connected pages. My next goals are to learn CSS to style my pages and JavaScript to make them interactive.
